

Why You Need Both: An EDW and a Supportive Organizational Structure

An EDW integrates data from across your enterprise. In healthcare, for example, you could tie cost accounting data, hospital billing data, clinical data, and patient satisfaction data.

Done correctly, this level of integration could help your organization analyze the following scenarios:

1. Which care is the most expensive, affordable, or profitable to deliver?
2. Which providers deliver care that results in the best clinical outcomes?
3. Which providers do patients rate highly for satisfaction?
